

Infrastructure as a Service (IaaS)

CTI-Global can provide Computing Infrastructure to our customers, in a variety of formats, depending on their requirements.

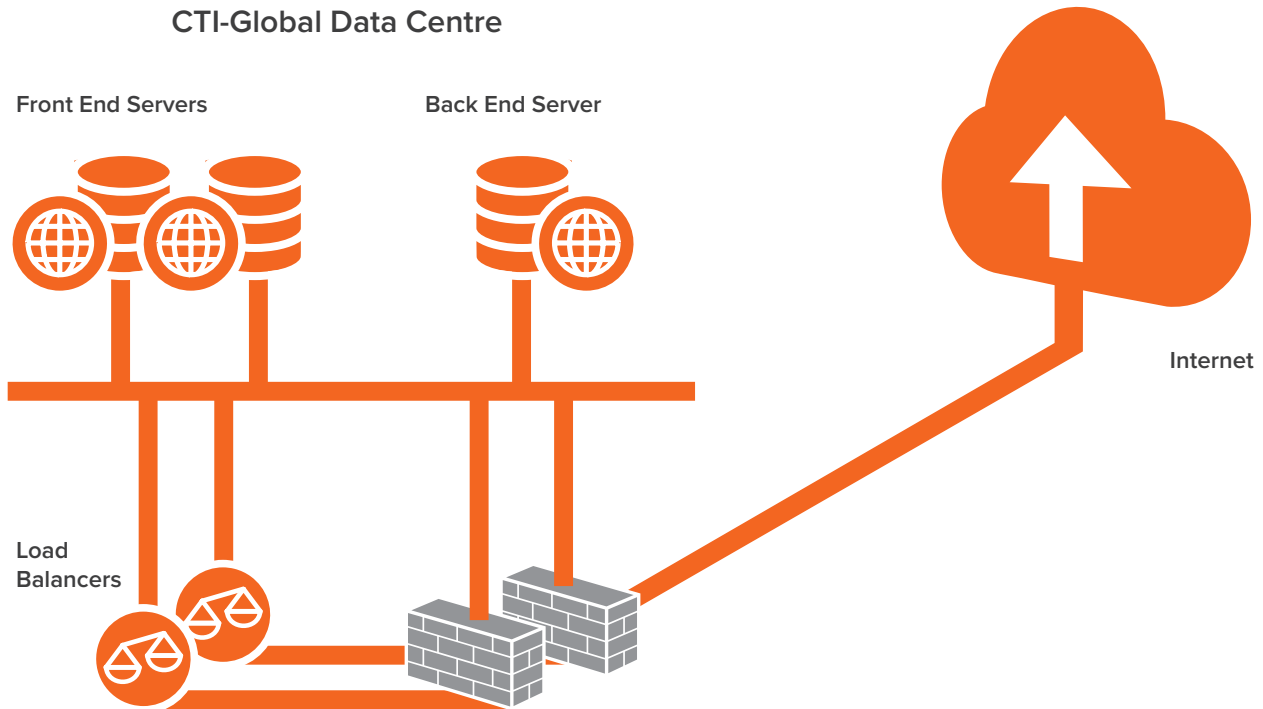

Services include:

- Public Cloud
- Private / Dedicated Cloud
- Co-Location
- Storage

- Flexible price plans
- 24/7 Support
- Comprehensive SLAs
- Change Control
- ISO 27001m certified service

Private Cloud

CTI-Global Data Centre

CTI can provide a number of Virtual Machines (VMs) to you which you can install a Guest Operating System, such as Linux or Windows, and any applications that you need to run.

CTI can also provide various additional services to use with these VMs:

- **Firewalls** – Full layer 7 firewalls provided in a Virtual or Physical format.
- **Connectivity** – typically the VMs will have access to the Internet with an allocated bandwidth, but private network connectivity can also be provided.
- **Load Balancers** – Provide load balancing over a number of servers or geographical locations which improves the concurrent user capacity and overall reliability of applications.
- **Monitoring** – CTI can provide you with monitoring and alerting of your systems.
- **BUaas and DRaas** – A range of Backup and DR services are available from CTI.
- **Web Application Firewalling**
- **DDOS Protection**

Dedicated Infrastructure / Co-Location

Instead of providing VMs, CTI can also provide dedicated hardware to our customers. This could range from a single server to a full data centre infrastructure.

As well as this, CTI can provide rack space so that a customer can co-locate their own hardware in the CTI Data Centres.

This hardware can be managed by the customer or by CTI, depending on the customer's preferences.

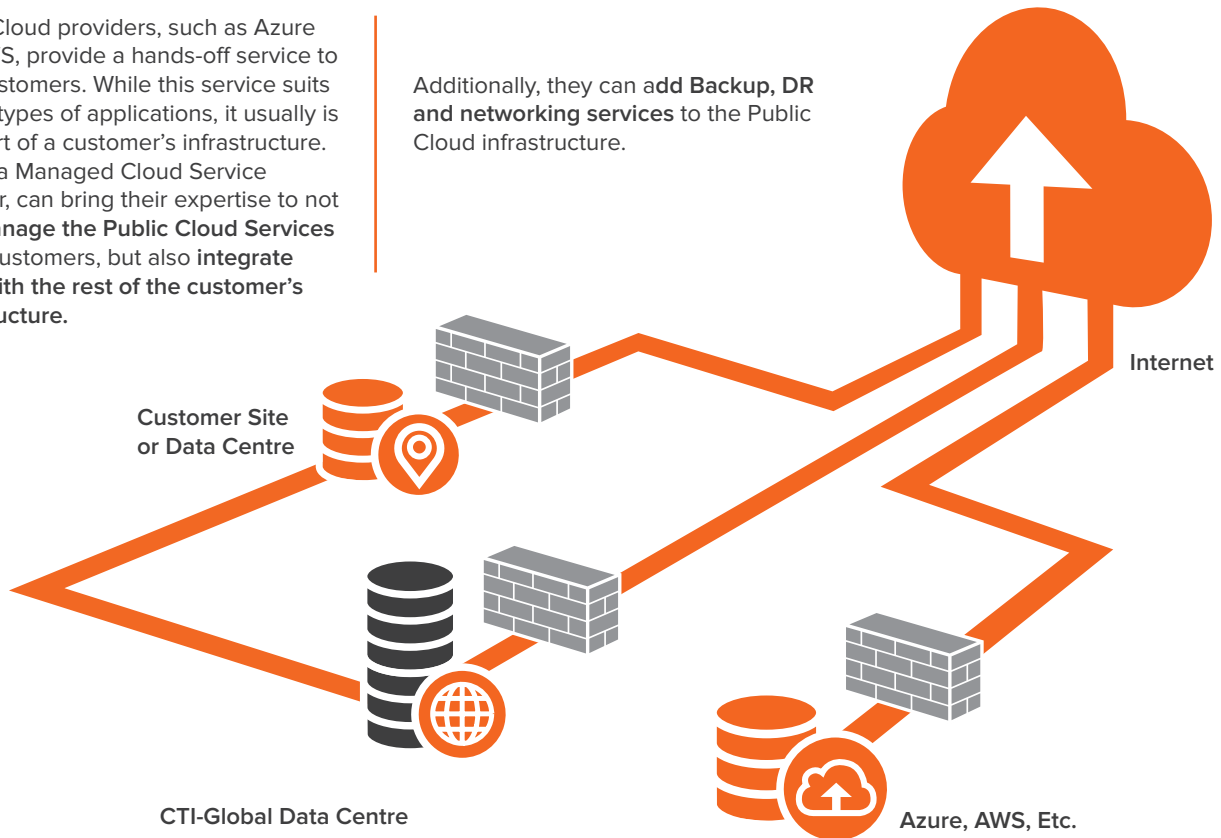

Similarly to the VM Private Cloud option, CTI can also provide all the Firewalling, Monitoring, Backup etc that our customers need for their dedicated or co-lo hardware.

Full orchestration service is available with our team able to take daily operational control of the infrastructure supported by comprehensive SLAs

Public Cloud

Public Cloud providers, such as Azure and AWS, provide a hands-off service to their customers. While this service suits certain types of applications, it usually is only part of a customer's infrastructure. CTI, as a Managed Cloud Service provider, can bring their expertise to not only manage the Public Cloud Services of our customers, but also integrate them with the rest of the customer's infrastructure.

Additionally, they can add Backup, DR and networking services to the Public Cloud infrastructure.
